High Quality Content by WIKIPEDIA articles! National Security Agency (NSA) Suite A Cryptography contains classified algorithms that will not be released. Suite A will be used for the protection of some categories of especially sensitive information (a small percentage of the overall national security-related information assurance market). The vast majority of the National Security Agency's work on encryption is classified, but from time to time NSA participates in standards processes or otherwise publishes information about its cryptographic algorithms. The NSA has categorized encryption items into four product types, and algorithms into two suites. The following is a brief and incomplete summary of public knowledge about NSA algorithms and protocols.
